

NOBODY MEMORISES POWER AUTOMATE

1,000+ connectors. 12,000+ actions. An expression language of its own. I stopped trying to hold it in my head and started asking ChatGPT instead.

SWIPE →

IT IS NOT A MEMORY PROBLEM.

1,000+ connectors. 12,000+ actions. New ones land every month. Nobody keeps that in their head — not the consultants, not the MVPs, not the person who built the flow last week.

1,000+

connectors

12,000+

actions

1

human memory

Knowing a thing exists beats knowing it by heart.

NOBODY CALLS A CALCULATOR CHEATING.

A calculator does not do the maths for you. It does the arithmetic so you can do the maths. Same bargain here: ChatGPT writes the syntax so you can spend your attention on the process.

THE ARITHMETIC

Expression syntax, connector names, the shape of a loop

THE MATHS

What the process is for, and whether it should run at all

The thinking stays yours. Only the typing moved.

ONE QUESTION WORKS. THE OTHER DOESN'T.

“Make me a Power Automate flow.”

It has to guess the trigger, the apps and the outcome. It guesses badly.

“When an email with an attachment arrives in Outlook, save the file to SharePoint and log the sender, subject and date in an Excel table.”

Trigger named. Apps named. Outcome named.

You are not writing a prompt. You are describing a job to somebody who cannot see your screen.

GOOD AT SYNTAX. FAST AT DRAFTS.

01

Expressions

`formatDateTime()`, `split()`, `coalesce()` — the functions you look up every single time, because nobody remembers the argument order.

02

The name of the thing

Which connector, which action, what it is called this month — the one buried six levels down a menu you only open twice a year.

03

The shape, before you build

A working skeleton in thirty seconds, so you find out the idea is wrong before you have spent an afternoon on it.

IT DOES NOT KNOW YOUR TENANT.

Your column names

It will confidently write “Vendor”
when your sheet says “Supplier ID”.

Your permissions

It cannot see which site you are
allowed to write to, or where you
are not.

Your approval chain

Who signs off, and what is supposed
to happen when they are on leave.

Whether it should exist

Some processes deserve deleting,
not automating. That call is yours.

It writes a plausible flow. Deciding whether it is
the right one is still the job.

ASK. TEST ON ONE. THEN TRUST IT.

01 Say it in one sentence — trigger, apps, outcome.

02 Build what comes back, and fix the field names it invented.

03 Run it once — one test row, or a mail you sent yourself.

04 Only then let it near anything that matters.

Never point a brand-new flow at a live mailbox.

**YOU DON'T NEED
TO REMEMBER IT.**

**YOU NEED TO
DESCRIBE IT.**

That is the whole skill. Name the trigger, name the apps, name the outcome — in the same plain words you would use to explain it to a colleague. The syntax is a lookup. It always was.

Which part of your week would you describe first? Tell me in the comments.
