

This tool can automate your tasks.

But only if you define everything.

NOT A MAGIC WAND — A SET OF STEPS

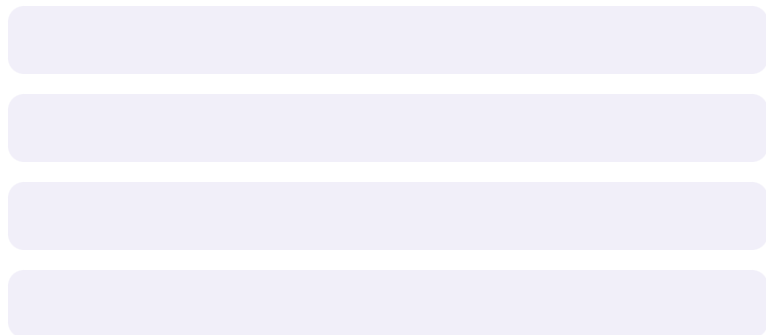

Every one of those blocks is something a human had to notice, decide and describe first.

It replaces manual steps. Not thinking.

WHAT PEOPLE EXPECT

“It does the work for me.”

one workflow, one task

WHAT ACTUALLY HAPPENS

“It does the steps I defined.”

trigger on new mail

check attachment exists

check file type is PDF

...and six more you forgot

one task, many steps

The work doesn't disappear. It moves — from doing the steps, to describing them precisely enough that a machine can.

Nothing happens unless you define it.

Miss one detail and it doesn't crash — it just quietly does the wrong thing.

01

Extract the email attachment

trigger

02

Clean and normalise the data

action

03

Log the row to the list

action

04

Send the daily recap

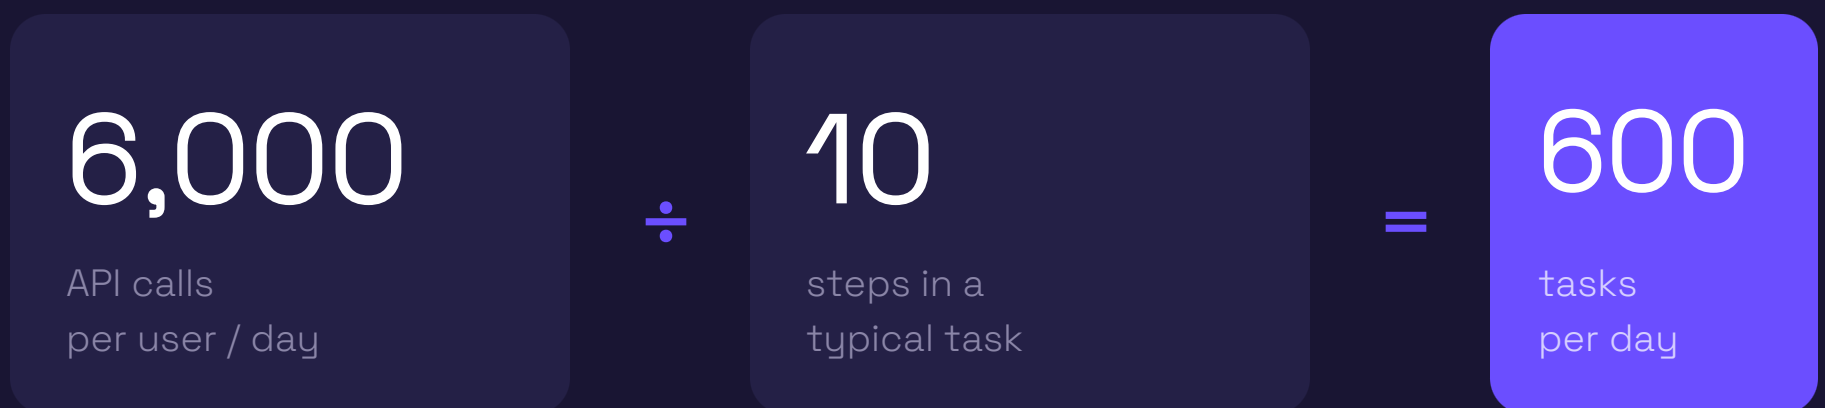

notify

THE ONE THAT BITES

What happens when the attachment isn't there? If you didn't say, it decided for you.

What one licence actually buys you.

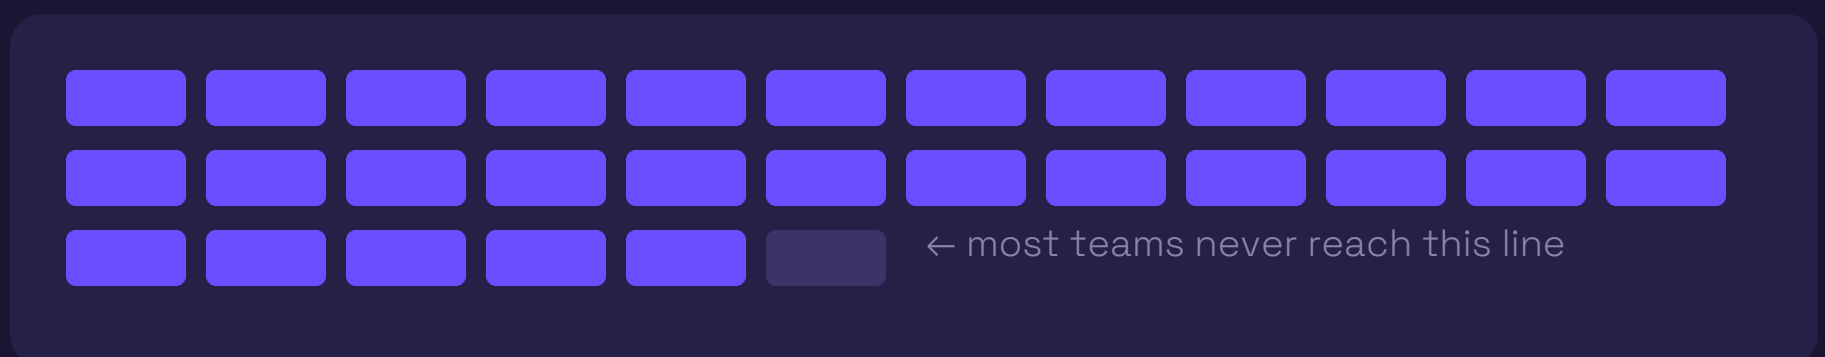

Microsoft 365 includes roughly 6,000 API calls per user, per day.

ONE TASK · TEN CALLS

A DAY'S BUDGET · EACH BLOCK = 20 TASKS

The ceiling is real, but it is not the constraint people think it is. Running out of ideas comes first.

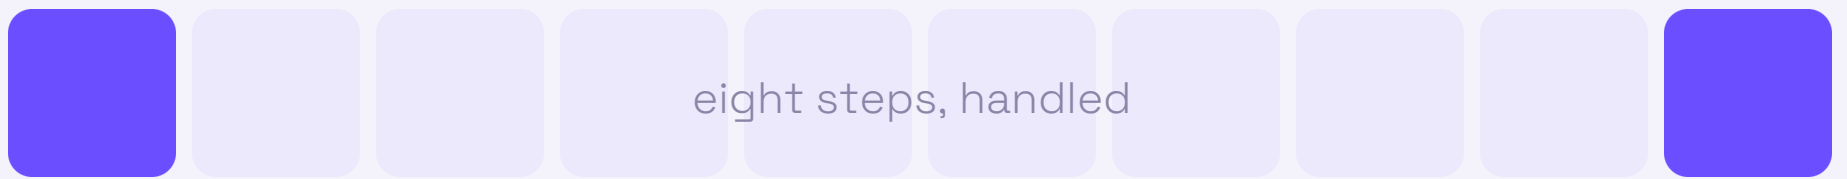

Same task. Two steps left for you.

BEFORE · TEN MANUAL STEPS

open mail · save file · open sheet · copy · paste · format · check · log · recap · send

AFTER · TWO HUMAN STEPS

you decide
it's worth sending

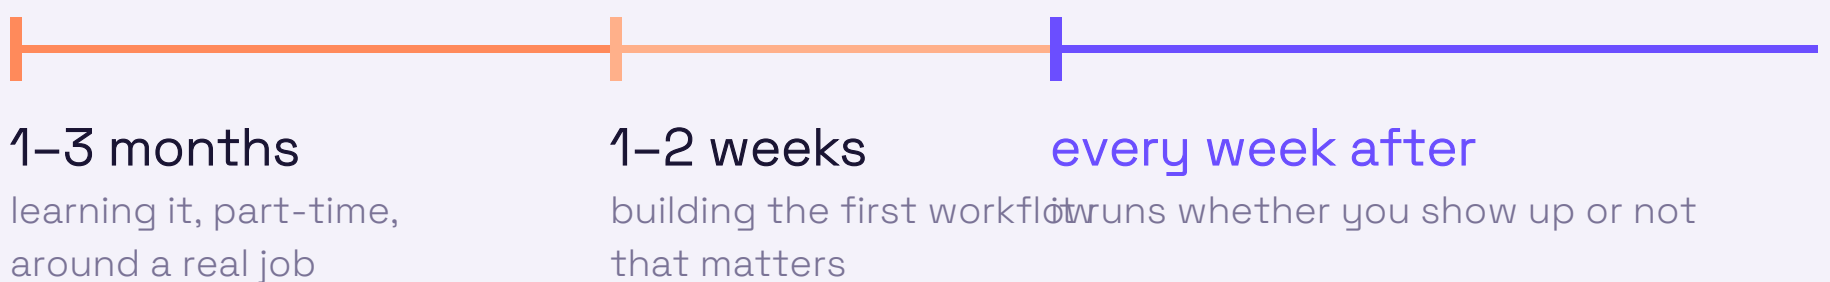

you read
the recap

THE PART NOBODY MEASURES

It isn't only the minutes. It's not holding ten steps in your head while someone interrupts you at step four.

Effort comes first. Payoff comes later.

This is the part most posts leave out, and it's the part that decides whether you actually start.

WHAT YOU GET

Runs 24/7 in the cloud
No laptop left switched on
Same result every time

WHAT IT COSTS

Upfront time you won't get back
Microsoft-shaped environment
Maintenance when things change

THE REAL CONSTRAINT

Not everyone wants to spend the first month getting nothing back. That's a fair choice — just make it knowingly.

Automation rewards investors, not spectators.

Every hour it saves you was paid for in advance.
That's not a catch — it's just how the trade works.

Tasks become steps

you define them

Steps become systems

they run without you

Systems free attention

the actual point

Which steps are you still repeating by hand?
